

S O U T H E R N
Hydro-Lawn
E A S Y S E E D I N G

PREPARATION

We recommend applying a layer of topsoil to areas that will be hydroseeded. The topsoil should be good quality screened soil applied to a minimum depth of 50mm all over.

- We require the soil to be leveled and not too heavily compacted/rolled.
- Just prior to hydroseed being applied, the soil should be raked up sufficiently to easily push your finger an inch into the soil.
- The soil is to be left dry.
- The sub-base should be firm, and the top soft and fluffy.
- All stones should be removed.
- Any weeds that have come through should be sprayed off.
- We recommend putting in an irrigation system, however any means to apply water to the whole area would suffice. Specific watering requirements should be discussed with Southern Hydrolawn.
- Once the hydroseed has been applied, foot traffic over the area should be kept to a minimum and animals should be kept off the area for at least 3 weeks.
- If there are areas of soils that are of a poorer quality, or that are too hard, you will notice a patchy effect in your lawn, so it is important to have good quality top soil and make sure the soil is raked up.
- Please see our maintenance guidelines document for information on how best to look after your hydroseeded lawn post-application.

Any questions please get in touch.
